Adjusting the Color Profile under Mac OS 10.6.x

Mac OS 10.6.x users connecting their laptop to the VGA input to display through the projector in the Central Pool classrooms may experience an issue in which the default color profile selected by the OS results in poor contrast, color, and brightness of images. This issue is resolved by following these steps on your laptop after you have connected to the VGA input:

1. Open System Preferences

![System Preferences](image)

2. Click on Displays

![Displays](image)

3. Select the window labeled VGA Display

4. At the top of the window, click Color

![Display Color](image)

5. Underneath the Display profile list, make sure Show profiles for this display only is not selected

![Show profiles for this display only](image)

6. In the Display profile list, select sRGB IEC61966-2.1

![Display profile list](image)

7. Quit System Preferences

The Mac OS will remember these settings for future use even after unplugging your laptop from the VGA input.
